

Help needed from each team. I need a list of all equipment that you will need when we connect a new meter run to our pipeline. All quality equipment for different volumes, efm equipment, control valves, shut in valves and etc. I'll need this by Tuesday of next week since there's a conference call to discuss and we plan to get this list to planning for future use. As some of you know we usually don't know about these connects until a level A cost estimate is given to marketing. This creates a lot of confusion by everyone once they let our customer's know what the cost to them will be without all the information.

Thanks

RJ
